Minded Security was established in Italy in 2007 with a focus on supporting businesses and organizations to build secure products and services.

The creation of Minded Security Research Lab resulted in some of the most important advancements in software security including the development of the first tool for Flash Security Testing (SWFintruder), and the first tool for Client Side Testing using Dynamic Tainting Analysis (DOMinatorPro).

Minded Security innovative technologies are the culmination of over many years of research and thousands of successful software security consulting engagements at leading public and private organizations throughout the world.

From 2014 Minded Security UK was created to host resources at Level 39 in London to accelerate R&D on application security products and for expanding current products and services in the European market.
